Task

- Store data from the LHC
 - 6% of ATLAS and 9% of ALICE
 - A few PiB/year to disk and tape, accelerating rate
 - Keep it for LHC lifetime + 15 years
- Provide computation for simulation, analysis, reconstruction
 - Through grid interfaces because that's what you can do when there are hundreds of resources in different places
 - Grid also fits well for defining a job with inputs, outputs and doing all the staging etc

We're supposed to look like this

norden

NordForsk

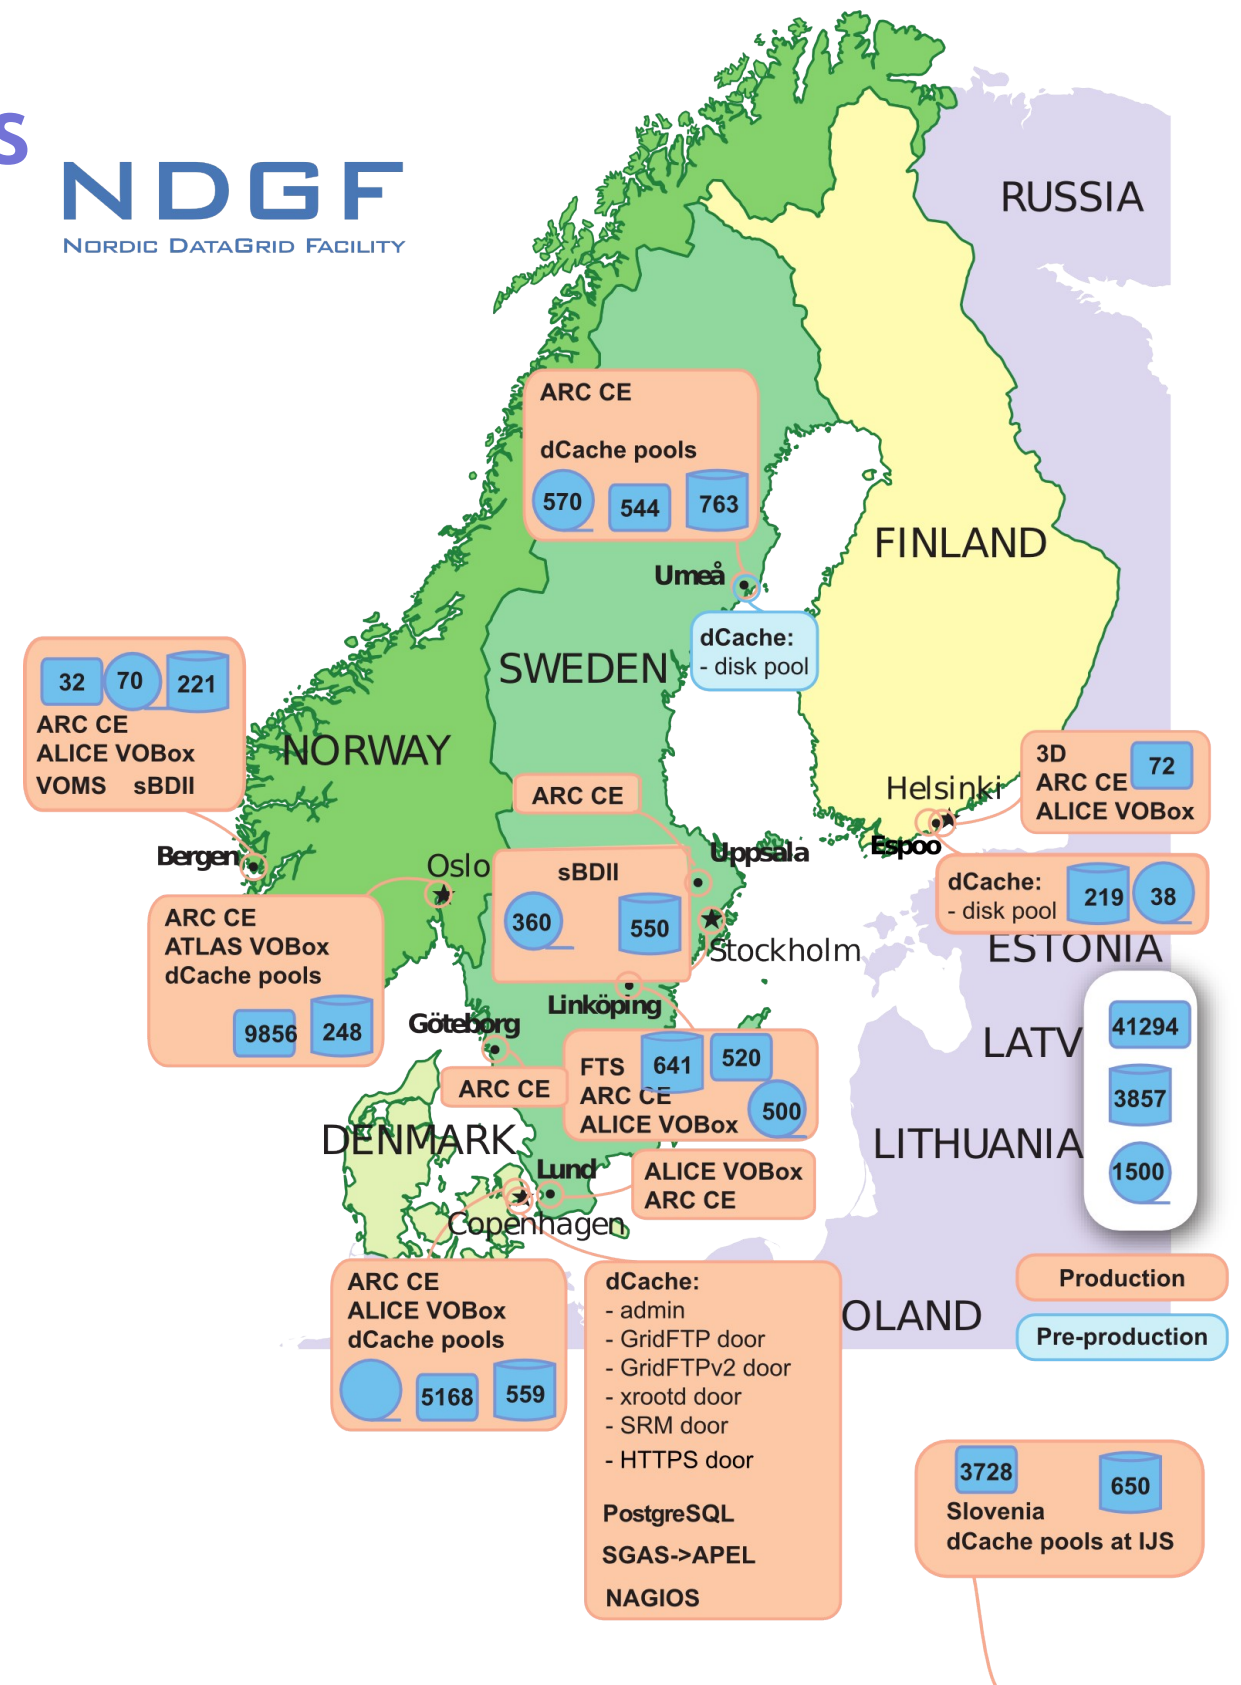

Nordic e-Infrastructure
Collaboration

While reality looked like this

NDGF
NORDIC DATAGRID FACILITY

- For completeness
 - Since then we have
 - Removed CSC tape
 - Decommissioned PDC
 - Added UiO tape
 - Removed Uppsala and Lund
 - Removed 3D
 - Added lots of resources
 - Moved pre-prod to ore

Collaboration

Idea

- Managed resources out at all our sites
- Coordinated by a central team and services into a coherent service for our users
- Shielding our users from most of the complexity of our distributed nature
- Shielding our site admins from most of the complexity of our users
 - Works really well for storage, computing is more decentralized
